My name is Nicola Lucas, I'm here with Chicago Glue and we're here to show you how to change the temperature on a Nordson ProBlue unit.

Change the temperature on the tank, on the keypad. You have these three buttons for your tank, your hoses, and your gun. For the tank, you press and hold the tank button. You're going to have a flashing number one in the first window. You want to use the arrow key to move over, enter in your set temperature that you want, hit the enter key, and hit the tank button again, and the tank temperature should be set. If you want to double check yourself, press and hold the tank button again, and you should have your temperature in the second window.

To do the hoses and the applicators, it is the same process. Select one or the other, whichever one you want to change. You'll again see a number one in the first window. For your hoses and your applicators, this is going to determine which hose and which applicator you want to change. You can change that number depending on how many are attached to your unit. So if I want to change the applicator two, I can hit the number two and then scroll over. It will change applicator number one, P300, hit enter, and to exit just hit any of the buttons on the top.

To check yourself, press and hold the button again and you should be at the temperature that you entered. The process is going to be the same for the hoses and the applicators. Thank you.
